THE INVENTION CLAIMED IS:

Patent claims

1. A mounting for a seat	(3) which rests on an underframe (1), having a
spring element (4) arranged on the	underframe (1), <u>wherein</u>

- the spring element (4) is positioned in a casing (5,5';6,6';600;600') and allows the latter to move elastically in the horizontal plane; and
 - b) the casing (5,5';6,6';600,600') is connected to the seat (3) or forms a part thereof.
- 2. The mounting as claimed in claim 1, wherein the spring element (4) is arranged at the top of an axial column (2) of the underframe (1).
 - 3. The mounting as claimed in claim 1 or 2, wherein the spring element (4) is arranged on an extensible, axially acting spring (2).
 - 4. The mounting as claimed in one of claims 1 to 3, wherein the spring element (4) is arranged at the top of an axially extensible push rod of a pneumatic spring (2).
 - 5. The mounting as claimed in one of claims 1 to 4, wherein the spring element (4) has an elastic outer sleeve (43), e.g. a rubber body.
 - 6. The mounting as claimed in one of claims 1 to 5, wherein
 - a) the casing (5,5';6,6') has a bottom, cup-like part (5,5') in which the spring element (4) is seated; and
 - b) the spring element (4) and the casing (5,5';6,6') have an axial through-passage (45;61,61').
 - 7. The mounting as claimed in one of claims 1 to 5, wherein
- a) the casing (600,600'), in which the spring element (4) is seated, is a cup-like part (600,600') which encases the spring element (4) from above; and
 - b) the spring element (4) and the casing (600,600') have an axial through-passage (45,61").

- 8. The mounting as claimed in one of claims 1 to 7, wherein
- a) the spring element (4) comprises an inner, preferably metallic core (44) and the elastic outer sleeve (43), which is arranged thereon; and
- b) the core (44) has an opening (45), preferably an axial through-passage (45), for accommodating the column (2).
 - 9. The mounting as claimed in one of claims 1 to 8, wherein the radial, outer circumference of the outer seeve (43) of the spring element (4)
- 10 a) is cylindrical; or
 - b) tapers conically in the upward direction; or
 - c) is essentially of cylindrical shape with a top and bottom reduction in diameter.
 - 10. The mounting as claimed in one of claims 1 to 6, 8 or 9, wherein
 - a) the spring element (4) is restrained at the top by a top molding (6,6');
 - b) the top molding (6,6') is connected to the casing (5,5'); and
 - c) the seat (3) is fastened on the top molding (6).
 - 11. The mounting as claimed in one of claims 1 to 10, wherein the core (44) is fixed to the outer sleeve (43).
 - 12. The mounting as claimed in one of claims 1 to 5, 7 to 9 or 11, wherein
 - a) the casing (600,600'), which is positioned on the spring element (4) from above, is fixed to the outer sleeve (43); and
 - b) the casing (600,600') may have a flange (601') for connection to the seat.
 - 13. The mounting as claimed in one of claims 1 to 12, wherein
 - a) provided in the top molding (6,6') or in the casing (600,600'), which is positioned on the spring element (4) from above, coaxially with the pneumatic-spring-forming central column (2), is a through-opening (61,61',61") for the purpose of actuating the triggering push rod (23) of the pneumatic spring; and
 - b) the axial through-passage (45) narrows conically.

- 14. The mounting as claimed in one of claims 1 to 13, wherein
- a) the through-opening (61,61',61") in the top molding (6,6') or in the casing (600,600'), which is positioned on the spring element (4) from above, has a defined geometry, e.g. a slot; and
- b) the internal core (44) of the spring element (4) has an extension (440) which projects into the through-opening (61,61',61") and is guided therein, as a result of which the moveability of the seat (3,3') is limited.
